1 The Horizon Video Management System

Horizon is a powerful, easy-to-set-up and easy-to-use Network Video Management system that lets you control multiple IP video cameras, record content continuously by time schedule or when triggered by motion detection, set up multiple user accounts with configurable privileges, and define rules and alarms.

**Admin Center** - The **Horizon Admin Center** application allows the user to initially set up the system, add cameras and other edge devices, set up schedules, rules and alarms, edit the configuration, and carry out routine maintenance. Once set up, the user can easily view the system components and make changes where necessary.

**Control Center** - The **Control Center** application allows one or more Users to connect to the system, watch live and recorded video and respond to alarms.

**Web Client** - A versatile **Web Client** allows any authorized user using a compatible browser to view live cameras and recordings, see alarms, and export clips from any PC on the user's corporate network http://[Horizon URL]/webclient
Compatible Browsers

Chrome: Version 29 and later
IE: Version 11 and later
Opera: Version 16 and later
Minimum resolution - 1280 x 800
On startup of the Horizon Admin Center, the User is shown a Login screen.
3 Home Screen

When a User logs in to Horizon, the Home screen is shown. *see Notes below

The Home screen shows the standard Sidebar on the left of the screen, and is divided into 3 sections:
1. Recommended Settings
2. Advanced Settings
3. Applications

The user can return to the Home screen from other system screens at any time, by clicking on the Home button in the Sidebar.

Notes:
In the following cases, the Home Screen is not the first screen shown:
1. The first time the Horizon Admin Center is run, a one-time Summary Screen is shown.
2. When running the Horizon Admin Center on a client machine, if the Server and Client machines are running different versions of the application, an Automatic Update window is shown.

'Check for Updates' link:
When running Horizon Admin Center on a Client machine, then if Automatic Updates are enabled, the user can click on the 'Check for Updates' link at the bottom of the screen to check if a minor version update is available.
3.1 Recommended Settings

The **Recommended Settings** are a series of links that take the user through the tasks that should be performed after the software is installed and the Initial Setup Wizard has been run.

**Recommended Settings**

- **Camera Settings**
  Assign camera name, choose recording mode, set resolution, frame rate etc.

- **Users**
  Create users and groups and assign permissions.

- **Create system sign-off report**

3.2 Applications

From the Home screen of the Admin Center application, the user can:

- launch the **Control Center application**,

- view the Control Center using a **Web browser**, or

- launch the **DNA Utility**.
3.2.1 Advanced Settings

The **Advanced Settings** allow the user to apply local conditions:
- set up Rules and Alarms, configure how much space is used for camera recordings, arrange according to 'Sites', and set up backup schedules.

3.3 Special Start-up Screens

In the following cases, the Home Screen is not the first screen shown:
1. The first time the Horizon Admin Center is run, a one-time [Summary Screen](#) is shown.
2. When running the Horizon Admin Center on a client machine, if the Server and Client machines are running different versions of the application, an [Automatic Update](#) window is shown.
3.3.1 Summary Screen - First time system is run

The Summary screen is shown after the Initial Startup Wizard has run, and the Horizon system has been started up for the first time.

The screen shows that the Initial Setup Wizard has already:

- **Discovered and set up cameras** that it found on the Video Network,
- **Initialized storage and started recording** using the parameters set in the Initial Startup Wizard, and
- **Created a structure for Users** allowing different sets of User permissions.

To continue, the User clicks OK and proceeds to the **Home Screen**, where the **Recommended Steps** show how to continue setting up the system.

3.3.2 Automatic Update

When running the Horizon Admin Center on a client machine, an Automatic Update window is shown if the Horizon Server has been updated and the client application is out of date. This gives the User the option to allow the application to be updated.

A progress bar is shown while the Update is taking place.
4 General Screen Layout

Horizon Admin Center screens normally include the Sidebar, an Item List, a Settings Page and a Help button.

4.1 Sidebar

The Sidebar is always on the left of the Horizon screen. It lets you access any of the system screens.

- The Home screen is opened when the Horizon system is started up. Clicking the Home screen button when completing a task on any other screen returns the user to this screen.

- The System button accesses the Server Settings, Licensing, Storage Setup, Site Setup, Maps, Maintenance, IT Setup, and Reports screens.
The Cameras button accesses the Edge Devices screens, which include the main Camera Settings screen, additional camera settings screens for Input Pins, Output Pins, Audio and Serial Ports. The button also accesses the Camera Sequence screen. In all these screens, there is a list of all cameras, and a Filter box which can be used to limit the displayed list to only show cameras who’s names include the text entered in the Filter box.

The Users button accesses the Users and User Groups screens.

The Rules and Alarms button opens the Rules and Alarms screens.

### 4.2 Item List

For any selected category in the Sidebar, the available items are listed. The required item can be selected and its name is then highlighted. Clicking a category in the Sidebar lists the available Items. Selecting an item in the list opens the corresponding Settings Page.

<table>
<thead>

</tbody>
</table>

C1-Development_H...
C2-GandA_Axis_19...
C3-Corridor_PTZ_19...
4.3 Settings Page

Depending on the functions required, Settings pages have different layouts. Screens may display all details for a single item, or may include tables that show a list of items with several parameters for each item.

Add and Edit buttons open dialog boxes where all required parameters for the selected item can be accessed. Editable fields are indicated by a Pencil icon for direct editing by the user or a Drop-down or range when a value can be selected from a list.

The Camera Settings screen below shows how different types of fields can be updated.
4.4 Help

The system has an extensive context-sensitive Help function. In any screen, clicking the 'Help' button opens a page of information about that screen, with specific information such as explanations about icons used, how to add, edit or delete entries, default values, cautions and notes where required.

To open the full Help Table of Contents:
1. Open the Help file by clicking on Help in the top right-hand corner of the screen.
2. Right-click anywhere in the Table of Contents, and select 'Open All' to see the full Table of Contents.

Opening the full Help Table of Contents
5 System Screens

The System icon access the following screens:
- **Dashboard**
- **Server Settings**
- **Licensing**
- **Storage Setup**
- **Site Setup**
- **Maps**
- **Logical IDs**
- **Maintenance**
- **IT Setup**
- **Reports**

5.1 Dashboard

The **Dashboard** gives a quick status check of the system. The information is divided into 3 panels - **Users**, **Cameras**, and **Storage**.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Icon Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>✅</td>
<td>Status - Good</td>
</tr>
</tbody>
</table>

The **Cameras** and **Storage** panels have an icon in the top right corner indicating the current status.
Status - Caution - check these components

1. Dashboard - Users Panel

The **User Panel** displays the users who are currently logged in to the system and shows which User group they belong to, to which application/s they are currently 'logged in', and from which computer.

2. Dashboard - Cameras Panel

The **Cameras Panel** shows the currently attached cameras and their status (Connected / Disconnected / Recording).

3. Dashboard - Storage Panel

The **Storage Panel** shows the current status of the Storage and the Archiving Lifespan.
5.2 Server Settings

The Server Settings screen is divided into 5 areas:

1. **System**
   Set the basic Server definitions:
   - **Name** - The default name is ‘System’. You can change this if required.
   - **ID** - The logical ID used for keypad navigation in the ControlCenter.

   **Note**: If more than one system is to be connected to a Control Center, the Administrator must ensure that each System has a unique system ID.

   - **Video Standard Format** - Defines the TV standard default that will be used (NTSC or PAL).

   The system will normally be configured to match the standard in your area.

   - **Time Zone** - Must be set to the correct timezone for your system.

   **Note**: This setting modifies the Windows Time Zone setting on the server.

   - **Default NTP Server** - If an external Time Server is to be used, check the box and enter the IP address of the NTP Server to be used.
2. Network
Caution:
These parameters should be set up in consultation with the User's IT Department. Changes should ONLY be made after consulting your Support Manager. Incorrect changes can cause major problems.

Network Interface on which cameras are installed - This shows the Network Interface Card (NIC) on which automatic discovery of cameras may be implemented. (Setting made when the first-time installation wizard was run).

Hostname - Displays the hostname of the Horizon Server. (Information only)

3. Mail Server Settings
Caution:
These parameters should be set up in consultation with the User's IT Department. The Mail Server information allows the system to send email messages automatically (example - generated by Actions associated with Alarms).

SMTP Address - Enter the address of the SMTP Mail server
SMTP Port - Enter the SMTP Port Number
Sender Address -
Use SSL Settings -
Server requires authentication -
The following fields are enabled when authentication is enabled:
User Name -
Password -
Note: Once an address for an SMTP Mail Server has been entered and saved, the system will display the current status of the connection (Connected or Disconnected)

4. IP Security
The IP Security settings allow the user to activate or deactivate Transport Layer Security (TLS) which enables encryption of communications between the Horizon and Web Clients.
Caution:
These parameters should be set up in consultation with the User's IT Department. The IP Security settings allow the user to activate or deactivate Transport Layer Security (TLS) which enables encryption of communications between the Horizon and Web Clients.
Preparing to set up TLS
The following steps must be completed before activating TLS.
1. In order to use this facility, the User's IT department must arrange for a suitable TLS Certificate to be accessible to the system.
2. The system is set up to use default port settings for this feature. The user should verify with the IT department that these ports are available. See IT Setup / Secured Video Transmission for External Connection.

Setting up TLS
The IP Security panel initially shows two buttons.

![IP Security Panel](image)

Only the 'Load TLS Certificate' button is enabled. Clicking on this button opens an Explorer window where the user can select a TLS Certificate to be used.

Select the .pfx file (that was previously acquired by your IT department), and click Open.

You will be asked for the Password associated with this Certificate.
When a valid password has been entered, the system returns to the main parameter screen, and this now shows the options to Replace or Remove the TLS Certificate, and the name of the issuer of the Certificate.

The display returns to the System Parameter screen. The user must **Save** the changes.

Once the changes have been saved, the system will restart Web Client connections, and all subsequent communications with Web Clients will be encrypted. The https connection and secure icon show in Web Client address bars:

**Replacing or Removing the TLS Certificate**

Once a Certificate is in use, the user is shown these options.

**IP Security**

The Replace option may only be used when an alternative Certificate is available.

The Remove option results in TLS encryption being discontinued, and further WebClient traffic is in the clear.
The user must confirm this action before it is carried out.

5. Misc Settings
   - **Automatically attach edge devices to the system** - Horizon runs a continuous scan on the selected NIC and discovers any cameras that have added.
   - **Note**: The default DHCP setting is that Horizon will act as a DHCP server and will set up IP addresses for cameras and client workstations connected on the VIDEO NIC.
   - **Use recorded stream in Adaptive Streaming** - Scales video resolution to the size of the video pane.
   - **Number of days to keep audited events** - Default 90
   - **Number of days to keep alarms** - Default 31
5.3 Licensing

The Licensing screen lists all the current License options for the system.

1. Acquiring or upgrading a license
   Note: For details of the licensing process, see the Horizon Release Notes.
   Summary: The first two lines of the Licensing screen are used when setting up the Horizon license.
   An Activation Key is provided by the Licensing site. That Key is used to create a Request File. The Request file is used on the Activation site to create a license, and the License can then be installed on the system.

2. Expiration Date - displays the validity of the license.

3. License Features table
   The table provides full details of all licenses features
   Feature Information column - For each entry, this shows the maximum allowed number of licensed instances.
   Usage column shows the number of instances of the component(feature) that are in use.
5.4 Storage Setup

The Storage Setup screen allows you to assign system drives for Video storage and allocate or increase the amount of disk space for video recordings.

The Storage Setup screen is divided into two sections: Drives Settings and Lifespan Settings:

1. Drives Settings

   This part of the screen lets the user choose which drives are to be used by the system, and to allocate how much space to use on each. All drives available on the Server are listed.

Drive information provided by the system:

   Drive (Letter), Used for (System/Data), Total Size (GB), Free Space (GB), Video Usage (%)

Fields accessible to the user:

   Assigned - Check the drives that are to be used by Horizon server to store recorded video.

   Allocated Size for Video - Enter the amount of disk space to allocate (in GB) for video storage. Click Apply for the setting to take effect.

   You can increase the amount of disk space allocated for video storage on a drive by editing this field.
Caution:
Once set, the amount of space allocated for video storage on a specific drive cannot be decreased.

2. Lifespan Settings
These parameters set the rules for how stored video is preserved.

**Behavior** - All cameras connected to the system are listed, and for each camera you can set stored video to be held for 'Maximum' or 'Minimum' days.

**Maximum** - (Maximum length of time the recording will be kept.) The recording will always be removed after the specified number of days. It does not guarantee that it will be available for that period of time.

**Minimum** - (Minimum length of time the recording will be kept.) The recording will be available for that length of time - it may still remain in the system after that, until its space is required for a newer recording.

**Schedule** - The recording lifespan to be applied for scheduled recording

**Motion/Event/Alarm/Manual [Days]** - The recording lifespan to be applied when recording was triggered by one of these Event Types (i.e. this may be different from the recording lifespan when recording was Scheduled). The recording will be available for that length of time - it may still remain in the system after that, until its space is required for a newer recording.

**Notes:**
1. Maximum: 365, Minimum: 1
2. There are separate parameters for video that was recorded according to a Schedule, and video that was recorded as the result of a Motion Detection trigger.

Copy lifespans settings to all - If all cameras are to use the same setting, you can complete one line and then click 'Copy Lifespan Settings to All'.

Note: This will copy the parameters to all cameras, but you still need to click Apply at the top of the screen in order for the changes to take effect.

5.5 Site Setup
The user can define Sites, and then associate one or more cameras with the Sites. This provides Control Center users with a more logical view of the system.
To Add or Edit a Site
To add a new Site, click on Add Site. The Add Site window will open. Enter the name for the new site. Return to the Site Setup screen, and drag-and-drop entities (cameras, maps, etc.) to create the structure you want.

Note: Drag till you see the 'outline' symbol
When moving an Entity to a site, hold the mouse-button and drag until you see the red 'outline' symbols on the target Site Name

To edit the Site Name, select the site you want to change and click on Rename. Enter the new name, click Save and then return to the Site Setup screen.

To Delete a Site
1. Use the mouse to drag-and-drop all entities that are associated with the Site that is to be deleted to another Site.
2. Select the Site to be deleted and click on Delete. You will be asked to confirm that you want to delete the Site. If there are any entities still associated with the Site, the system will not allow the deletion.

5.6 Maps
Maps are either Map files (Graphic images that will be the background pictures on which Camera can be positioned), or Web Pages (which can be external web pages like Google Maps, or simple file references providing a convenient way for displaying information to Control Center Operators).
Add Maps Dialog

The system will open a Windows Dialog box. Select the graphics file containing the image to be used (jpg, png, bmp or gif), and click Open.
Once a background image is chosen, the **Add Map** screen will open.
Cameras may be 'dragged' onto the map to indicate their position.
Right-clicking on the camera icon opens a dialog box which allows additional options to be activated.

<table>
<thead>
<tr>
<th>Option</th>
<th>Control Center Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show name</td>
<td>Camera Name is displayed when the Map is viewed</td>
</tr>
<tr>
<td>Show field of view</td>
<td>The apparent field of view of the camera is added to the icon.</td>
</tr>
<tr>
<td>Display video</td>
<td>Hovering the mouse over the camera icon opens a small preview window on the tile displaying the map</td>
</tr>
<tr>
<td>Use bright caption</td>
<td>Camera Name is displayed in bright font - suitable for dark backgrounds (e.g. Geographic Maps)</td>
</tr>
<tr>
<td>Remove</td>
<td>Removes this map from the list of Maps</td>
</tr>
</tbody>
</table>

**Add Web Page Dialog**

The web page dialog is used to add files or URLs that can be displayed in the tiles of the Control Center.

1. If an external website is to be displayed, then enter use its regular URL in the URL field (e.g. `https://maps` etc).
   If a local file is required, erase the `http://` in the URL field, replace with the full file path (e.g. `C:\Folder\subfolder\filename.filetype`).
2. Enter a Map name in the Name field and click **Save**.
5.7 Logical IDs

All entities in the system have Logical IDs assigned to them. Horizon allows the user to use the Logical IDs that apply to Cameras, Tile Layouts and Monitors. This screen allows the user to see the current Logical IDs assigned to these entities and to edit them if necessary.

The user selects which entities to display using the pulldown box at the top of the screen. Entity names can be edited in the Name column, and Logical IDs can be incremented/decremented using the control in the Logical Id column.

Logical IDs for each type of entity must be unique - if the user selects a Logical Id that is already in use, the system will not allow the value to be saved, and will display a message indicating that another value must be selected.

Logical IDs are shown in the Control Center and in the Web Client as numeric values following the Entity name.

In the Control Center the user can use either the workstation keyboard or a CCTV Keyboard to control a display. Details are provided in the Control Center Help file.
5.8 Maintenance
The Maintenance links allow the user to export log files and to do manual or scheduled backups of the database.

To Export Logs
Click on the Export Logs button. The system will open a Windows File window, pointing at the default location, and giving a file name 'HorizonLogs.zip'. Edit if necessary, and click Save.

To Backup the Database immediately
Click on the Backup Now button. The system will open a Windows File window, pointing at the default location, and giving a file name 'HorizonDB.zip'. Edit if necessary, and click Save.

To Create/modify the Schedule for database backups
1. Click the Scheduled Backup button. The system will open the Schedule backup window.
2. Check 'Enable schedule backup' to initiate scheduled backups.

3. Set the time for backups to be made, and check the day/s on which the backup should be run.

4. Click the Save button.
   The system will display the time, date, and path for the Database backups.
   e.g. 'Next schedule on: Sunday, May 19, 2013 ,12:AM'
   'Server Backup Path: C:\Program Files\[System Designation]\Directory\Backup'

5.9 IT Setup

The system uses several external interfaces. The IT Setup screen initially shows the system's default networking parameters.

Caution:
Alternative values may be set where necessary. All networking related parameters should only be set up after consultation with your FLIR Systems, Inc representative and your IT Department

The system displays all the current network port settings used by the Horizon server for the features listed.

Allow External Connection (From WAN)* - allows client workstations running Horizon Admin Center and/or Control Center applications to connect from the Internet.
Web Server - used to support connections from Web Clients (information only, cannot be changed)
Secured Web Server - port allocated for TLS communication
Web Server Video Transmission (RTSP)* - used to stream video to web clients.
Mobile Viewing Application* - allows connections from Horizon-supported mobile video applications.
Video Transmission For External Connections* - used for sending video to client workstations and Horizon-supported mobile applications connected from the Internet.
Secured Video Transmission for External Connections - port for encrypted transmissions to Web Clients

**Note:** For setting up TLS, see Server Settings / IP Security

**Settings** - Clicking on the Video Transmission Settings button opens a Dialog box allowing the user to change the default quality settings for external video streaming.

**Automatic Client Applications Distribution** - used by Horizon when updating Client Application software (information only, cannot be changed)

**Server Serial Port** - used for connecting external systems such as Access Control, Building Management. After selecting a COM port using the drop-down box, the Settings button will be enabled.
Click on the Settings button to select the communication protocol and parameters to be used.

* **Important Note:** Enabling access to the internal network (LAN) from the Internet (WAN) requires advanced networking knowledge. Changes to these settings should only be made in consultation with the IT department and your support representative.

After making any change, the user must click the **Apply** button.
The **Undo** button will clear all unsaved changes and re-display the stored settings.

After applying changes, press the **Print** button to print out all the information.
Clicking on this button opens the Windows Print dialog window, select a printer and press “Print”.
Keep the printed list available for IT and Support staff.
5.10 Reports
The Reports screen allows the user to produce a range of reports either using simple default settings, or, depending on the report, setting specific parameters.

The available reports are listed in the Report Type drop-down.

<table>
<thead>
<tr>
<th>Report Type</th>
<th>Parameters</th>
<th>Filter Parameters Available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarms History</td>
<td>Time Range&lt;br&gt;Last 24 hours, Past Week, Past Month.&lt;br&gt;Manual selection – Enables the user to enter a custom time range.</td>
<td>By Column and Text</td>
</tr>
<tr>
<td>User Logon History</td>
<td>Time Range&lt;br&gt;Last 24 hours, Past Week, Past Month.&lt;br&gt;Manual selection – Enables the user to enter a custom time range.</td>
<td>By Column and Text</td>
</tr>
<tr>
<td>SignOff</td>
<td>No Parameters. Produces a report which can be signed off between Integrator and User, giving summary of the Installation.</td>
<td></td>
</tr>
<tr>
<td>System Status</td>
<td>No Parameters. Produces a System summary.</td>
<td></td>
</tr>
</tbody>
</table>
The << symbol allows the display area to be enlarged.

Click on Generate to create a Report.
Once a report has been generated, the report will be previewed on the screen, and the Print and Save As fields will be enabled. Provided the Mail Server Settings were set in the Server Settings screen, the Send To field will also be enabled.

Print Opens a standard Windows Print dialog, allowing the report to be printed.
Save As Opens a File Explorer dialog, allowing the report to be saved.
Send To Opens an Email dialog. Users with addresses stored in the system may be selected, and/or full email addresses of others may be added.
6 Cameras Screens

The Cameras button accesses the Edge Devices screens.

**Edge Devices** - this screen summarizes all Edge Devices connected to the system.

More details about Edge Devices are shown in the following screens:

- [Camera Settings](#)
  - Input Pins
  - Output Pins
  - Audio
  - Serial Ports
- [Camera Sequence](#)
- [Camera List](#)
6.1 Edge Devices

The Edge Devices screen provides a complete list of all devices currently connected to the system, shows whether they are currently 'attached', and gives their basic device details. After making any change, the user must click the Apply button. The Undo button will clear all unsaved changes and re-display the stored settings.

1. Rescan Network

Horizon regularly scans the system's default network (defined in the Server Settings screen) and adds any new devices it finds. If the rescan icon is turning, this means a scan is in progress, and you may need to wait until it is complete before new devices are shown.

Pressing the Rescan Network button causes a rescan to start immediately.

Note: Devices that are not on the default network will NOT be discovered by the automatic scan, and must be added manually (see below).

2. Adding Devices Manually - See the separate topic Adding New Devices
3. Replacing Devices
   a. Select the camera to be replaced,
   b. Click Replace Device. A window will open showing all cameras available (i.e. having the same Vendor and Model).
   c. Select the camera that you wish to use instead of the current one, and click Save.

Note: Where a replacement camera has already been set with the same IP address as the selected camera and connected to the system, it will be discovered by the automatic rescan and its entry in the Replace Device screen will be in bold font.

4. Device Credentials
   Clicking on this button shows the Device Credentials to be used by the system for the connecting to the selected device. These stored credentials can be modified and saved.
   **Note:** This does not change the credentials in the device - it only affects the stored credentials that the system uses when connecting to the device.

5. Delete
   Clicking on the Delete button will delete the currently selected device. You will be asked to confirm that you want to delete it.

   **Caution:** Deleting a device from the Edge Device list will completely remove the device itself and all recorded material associated with it.
   If you subsequently rediscover the same device (Manually or with the automatic rescan), no previously-recorded material can be recovered.

   If, instead of Deleting, you uncheck the 'Attached' box, the entry will remain in the table, and recordings will still be accessible.

6. Discovery Settings
   This button opens the Discovery Settings dialog box where you can specify the type of device scanning to be performed (Proprietary or ONVIF), and the vendor/model ranges to be included in the scan. The scan settings and credentials that will be used for the vendor/model range of the selected (highlighted) device are shown.
Checking the **Select all** check-box will cause the system to scan for all possible vendor/model ranges. Normally, one should check only those Plugin entries that need to be scanned. This will make the scanning process quicker.

When the **FLIR** check-box is checked, this allows scanning for all FLIR Core Camera Products, as indicated by the **Common Settings** entry in **Product Settings**

**Note:** FLIR Recorders are an exception to this rule - FLIR Recorders cannot be discovered automatically, and user should use the Add Device Manually option to discover them.

If the user wishes to make changes to the stored settings for a product group, the appropriate entry in the Plugin list can be selected and the stored settings for that product or group will be displayed.

Similarly, by highlighting an entry in the Plugin list, the Plugin Settings for that Product Group are shown, and the user then has the opportunity to enter any special values as required. These may include **User Name**, **Password**, **Port**, **Begin/End Port**, etc.

After pressing **Save**, the settings will be used for the automatic scanning process. Devices that have been added will be shown when the next scan is completed. If required, you can click on **Rescan Network** to force a rescan to start.

**7. License information**

The system shows the total number of channels for which the system is licensed, and the number of channels currently being consumed.

**8. Details for:**

(Model and IP address of selected camera)

The Name, IP Address, and supported device capabilities for the selected device are displayed.)
6.1.1 Input Pins

The Input Pins screen shows a list of all input pins on attached devices.

The IP Address, Vendor, Model and Port Id are indicated. The default Name is shown - this can be edited if required.

A drop-down menu in the Normal Status field allows the pin to be set to Open (NO) or Closed (NC). Depending on this setting, the adjacent field indicates the current state of the pin.

After making any change, the user must click the Apply button. The Undo button will clear all unsaved changes and re-display the stored settings.
6.1.2 Output Pins

The Output Pins screen shows a list of all output pins on attached devices.

The IP Address, Vendor, Model and Port Id are indicated. The default Name is shown - this can be edited if required.

A drop-down menu in the Normal Status field allows the pin to be set to Open (NO) or Closed (NC). Depending on this setting, the adjacent field indicates the current state of the pin.

After making any change, the user must click the Apply button. The Undo button will clear all unsaved changes and re-display the stored settings.
6.1.3 Audio

The Audio Ports screen shows a list of all attached Edge Devices with Audio Ports.

The IP Address, Vendor, Model and Camera Name are indicated.

The user can select which Audio Port on the camera is to be used (1,2).

Clicking a box in the Enable Audio column activates/deactivates the audio port for the selected device. Clicking the box in the Heading row will enable/disable all audio ports. After making any change, the user must click the Apply button. The Undo button will clear all unsaved changes and re-display the stored settings.
6.1.4 Serial Ports

The **Serial Ports** screen shows a list of all Serial Ports on attached devices.

The **IP Address** and **Serial Port** type (RS232, RS4xx, ..) are indicated.

The user can select the required values for the **Serial Port Parameters** listed below.

**Serial Port parameters**

**Usage** - (None, Keyboard, PTZ)

**Communications** - (RS-232, RS422 4 wire/2-wire, etc)

**Protocol** - (DVTEL, Pelco, American Dynamics)

**Bitrate** - (75, 110, . . . . . , 912600)

**Data Bits** - (7,8)

**Stop Bits** - (1, 2)

**Parity** - (None, Odd, Even)

After making any change, the user must click the **Apply** button.

The **Undo** button will clear all unsaved changes and re-display the stored settings.
6.1.5 Adding New Devices

The Add Device Manually button allows you to add devices that are not on the default network. Clicking the button opens the Add Devices dialog box, where you can specify an IP address and choose a Vendor/model range. The default credentials for the selected vendor/model range are shown.

The dialog box allows the user to enter an IP address and select a Vendor/model. The default login information for the device is displayed, depending on what is required for the particular device.

6.2 Camera Settings

Camera Settings - This screen is used to view and configure the most common settings for all the cameras currently attached to the system.

The table shows all the cameras currently attached to the system, their current status, and their most important settings. You can select a particular camera in the table, preview its output, and edit its basic parameters.

To view and/or edit more detailed camera parameters, select the camera in the item list.
Cameras Screens

1. Selected Camera
The Camera Name, IP Address, and Driver Details for the selected camera are shown.

2. Preview Window
The preview window shows the selected camera's output
Show OSD - When this box is checked, OSD information will be shown for this camera.

3. Apply / Undo
After making any change, the user must click the Apply button.
The Undo button will clear all unsaved changes and re-display the stored settings.
4. **Table of all Attached Cameras**
   Clicking on any camera in the list will 'select' it.

5. **Selected Camera Details**
   The selected camera's details and preview will be shown, and the parameter fields in the table can be edited. Drop-downs indicate where other parameters may be selected. Only values that are valid for the selected parameter are shown. Where parameters are disabled (grayed out) this indicates that no other choices are available.

   **Status** - Cameras can be in the following states:
   - Connected
   - Disconnected
   - Recording
   (see full List of possible Camera States)

   **Camera Name** - The system assigns a default name when the camera is discovered. You can edit this field to put in a camera name of your choice.

   **Recording Mode** - Choose Off, Always, Motion or **Custom**.
   (For Custom, see Recording Schedule)

   **Resolution**, **Frame Rate** and **Compression Quality** - pull-down lists give the values that are available. The options available depend on the characteristics of the individual cameras.

6. **Copy Configuration Button** - This opens the Copy Configuration dialog box, where you can take all or some values from the selected camera, and apply them to one or more other connected cameras in the system.

7. **Calculated Bitrate** - The system shows the bitrate that each camera will use, based on the selected Resolution, Frame Rate and Compression Quality.

8. **No. of Streams** - Indicates if the camera is supplying separate streams for Live viewing and for Recording. Characteristics of the recorded stream are available as a tooltip, shown by hovering the mouse over the **No. of streams** entry for the relevant camera.
   **Note:** The No. of Streams column is only shown if one or more cameras have the Dual Stream feature enabled.

9. **Estimated Archive Lifespan** - The system displays the calculated storage capacity based on the amount of storage allocated and the camera parameters that have been chosen.

6.2.1 **Recording Schedule**
To create or update a Recording Schedule for a Camera:
1. Select **Cameras** in the Sidebar, select **Camera Settings**, and select the required Camera from the table.
2. In the **Recording Mode** column, use the drop-down to select **Custom**
3. Click on the 'Custom' link
4. This Recording Schedule dialog box will open.
The Recording Schedule dialog is used to set up or modify time patterns during which Recording will be activated. Each camera can have its own schedule.

The Recording Schedule is indicated by the color of the blocks in the schedule graph. All cameras are initially set to the default 'Continuous' schedule - as shown by the continuous green blocks.

To Create a new Schedule
1. From the Device drop-down, select the camera for which the schedule is being created.
2. Choose the Selection Mode radio button for the type of Recording required.
   - Continuous - This is the default - Initially, all blocks in the schedule show 'Continuous'. If necessary, after you have added other modes, you can always go back and reset some of the schedule to 'Continuous'.
   - Motion - The camera will record when Motion is detected (including the pre- and post-event recording - see Camera Motion Settings parameters of the Camera - Detailed Settings for Motion Detection, Video, Picture and PTZ screen)
   - Off - The camera will not record
3. Use the mouse to click and drag through times and days during which the selected mode will apply - the color in the selected blocks will change to indicate the selected mode, 'Continuous', 'Motion' or 'None'.
4. If required, you can then set a different Recording Mode Using the radio buttons), and add more blocks in the schedule.
5. When the schedule is complete, click OK.

To Edit an existing Schedule
1. Select the camera for which the schedule should be edited by clicking on it in the list of cameras.
2. Edit the blocks in the schedule.
3. When you have made the required changes, click **OK**.

### 6.2.2 Copy Configuration

The **Copy Configuration** dialog box allows the user to copy one or more settings from an existing camera to additional camera/s.

![Copy Configuration dialog box](image)

**Source**

When you enter the Copy Configuration dialog box, the selected camera in the Camera settings screen will appear as the Source. You can select a different Source from the drop-down list of cameras.

The list of **Stream Settings** parameters (Resolution, Frame Rate, and Quality), and **Recording Mode** shows those parameters that will be copied from the source camera. The parameters making up the list will vary according to the vendor/model of camera selected, and the values for those parameters as set in the source camera will be shown.

Check whether to copy the **Stream Settings** parameters and/or the **Recording Mode** setting. If you do not select a parameter, then the Destination cameras' default value for that parameter will be used.

**Destination**

The Destination field lists all the attached cameras that are capable of using the selected source parameters.

**All / Search Filter** - The **All** check-box allows you to select all the listed cameras. Otherwise you can check just those cameras that you want to use the selected camera's parameters.
Cameras Screens

Entering text in the **Search Filter** will reduce the list of available cameras and show only those possible Destination cameras whose Names have text that corresponds to the text entered.

**Note when dealing with cameras that may have their Dual Stream capability enabled.** When copying parameters from a source camera that only has one stream running, the destination cameras will have their second stream disabled by the Copy action. When copying parameters from a source camera that has two streams running, the destination cameras will have their second stream enabled by the Copy action.

Click **OK** to apply the chosen settings to all the selected cameras.

### 6.2.3 List of possible Camera States

**Status** - Camera status in the table can be shown as one of the following:

<table>
<thead>
<tr>
<th>IP Fixed Camera</th>
<th>IP PTZ</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Connected" /></td>
<td><img src="image2" alt="Connected" /></td>
<td>Connected</td>
</tr>
<tr>
<td><img src="image3" alt="Recording" /></td>
<td><img src="image4" alt="Recording" /></td>
<td>Recording</td>
</tr>
<tr>
<td><img src="image5" alt="Disconnected" /></td>
<td><img src="image6" alt="Disconnected" /></td>
<td>Disconnected</td>
</tr>
<tr>
<td><img src="image7" alt="Recording failed" /></td>
<td><img src="image8" alt="Recording failed" /></td>
<td>Recording failed</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Encoder &amp; Camera</th>
<th>Encoder &amp; Camera</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image9" alt="Has warning" /></td>
<td><img src="image10" alt="Has warning" /></td>
<td>Has warning (connection from camera to encoder is lost)</td>
</tr>
<tr>
<td><img src="image11" alt="Recording has warning" /></td>
<td><img src="image12" alt="Recording has warning" /></td>
<td>Recording has warning (connection from camera to encoder is lost)</td>
</tr>
</tbody>
</table>
6.3 Camera Sequence

A Camera Sequence allows several cameras to be displayed one after the other in a single tile of the Control Center.

The **Camera Sequence** screen displays a list of the Camera Sequences that have already been configured in the Item list. The cameras making up the selected Camera Sequence are displayed in a table in the Camera Settings Page, with each camera showing the time for which it will be displayed (the 'dwell time'). A preview window shows the Camera Sequence as it will appear in a Control Center tile.
To Add a new Camera Sequence

1. Click the Add Camera Sequence button. The Add Camera Sequence window will open.

2. Enter a Name for the Camera Sequence.
3. Add or remove cameras by using the left and right arrows.
4. Set the Dwell Time (and Preset parameters if required).
5. Arrange the order of the cameras in the sequence using the up and down arrows. When you have made the required changes, click on the Save button.
To Edit a Camera Sequence
1. Select the sequence to be edited by clicking on it in the Camera Sequence List.
2. Click the Edit button.
   The Edit Sequence window will open.

3. You can make the following changes:
   a. Edit the Name of the Sequence.
   b. Add or remove cameras by using the left and right arrows.
   c. Change the Dwell Time or Preset parameters.
   d. Change the order of the cameras in the sequence using the up and down arrows.

4. When you have made the required changes, click on the Save button.

To Delete a Camera Sequence
1. Select the Sequence to be deleted by clicking on it in the Camera Sequence List.
2. Click the Delete button.
   You will be asked to confirm that the Sequence is to be deleted.
6.4 Camera List

The Camera List shows all the cameras that are currently attached to the system.

You can then select an individual camera and show its details in the Camera Details screen.

When a camera is selected, the Camera Details screen is shown. Clicking on each of the tabs (Video Settings, Picture Settings, PTZ), displays the corresponding settings.

Note: If the camera selected is not a PTZ camera, the PTZ tab will be disabled.
6.4.1 Camera - Detailed Settings Tabs for different Camera Capabilities

The detailed settings of the selected camera are shown.

Cameras are initially set with default parameters. Drop-downs indicate where other parameters may be selected. Only parameters that are valid for the selected parameter are shown. Where parameters are disabled (grayed out) this indicates that no other choices are available.

1. Camera Name
   The top of the screen shows the selected Camera Name and the regular Horizon buttons allowing the user to **Apply** or **Undo** any changes that have been made, and to access the **Help** system.

2. Preview Window
   The Preview Window shows the live image from the selected camera.

   The paragraphs below provide more information

**Available Tabs**
The following Settings Tabs present the corresponding parameters for the selected camera. The selection of tabs shown will vary according to the capabilities of the camera.
Enable Panoramic Lens Configuration
This tab allows activation of panoramic ("Fisheye") lens capability, when a suitably-equipped camera (such as the Quasar Gen 2), is used or where the associated camera is fitted with a suitable lens.

Depending on the type of camera, the applicable list of parameters is shown.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brand</td>
<td>Quasar, Sentry, Immervision</td>
</tr>
<tr>
<td>RPL Number</td>
<td>Select the appropriate Lens Model</td>
</tr>
<tr>
<td></td>
<td>(Only shown if Immervision)</td>
</tr>
<tr>
<td>Position</td>
<td>Ceiling, Ground, Wall (not available for Sentry)</td>
</tr>
<tr>
<td>Calibrate</td>
<td>Enable/Disable (Not available for Sentry)</td>
</tr>
<tr>
<td></td>
<td>(Only required for Sentry)</td>
</tr>
</tbody>
</table>

6.4.1.1 Video Settings
By default, the Video Settings tab is always selected when going to the Camera Screen. If one of the other tabs has been selected, the user can return to this tab by clicking on it.
Note:

Resolution, Frame Rate and Compression Quality - Default settings are assigned by the system when the camera is discovered. These should generally not be altered.

Calculated Bitrate - This value is provided by the system.

Enable recorded stream (Click for more detail)

When enabled, this check-box indicates that the selected camera supports dual-stream output. This allows different resolutions to be set for the two streams, so that, for example, a high-definition image can be used for live viewing, and a lower-resolution image (which will consume less archive space) can be stored.

Checking the box opens a second set of Camera Settings parameters, where the characteristics of the recorded stream can be set.

Saving your Settings

Select the required settings, and then click Apply.
Once the settings have been applied, then the details can be seen in a tooltip that is available in the Camera Settings screen, by hovering the mouse over the ‘No. of Streams’ entry for the relevant camera.

6.4.1.2 Picture Settings

Setting up the best picture

Brightness, Contrast - These two settings are generally adjusted by the user - move the sliders to obtain the best picture in the Preview window.

  Default settings are assigned by the system when the camera is discovered. These should generally not be altered.

Other parameters

  Wide Dynamic range - This parameter is only enabled for cameras that support the feature.

  Rotate Image - Set this parameter to give correct orientation to the picture.

Advanced Settings - Checking this box enables access to the Advanced Settings.

Saving your Settings

Select the required settings, and then click Apply.
### 6.4.1.3 Thermal Settings

**Note:** This Tab is only shown when the selected Entity is a Thermal Camera

<table>
<thead>
<tr>
<th>Video Settings</th>
<th>Thermal Settings</th>
<th>PTZ</th>
<th>Analytics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color Palette</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Digital Detail Enhancement</td>
<td>Auto</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AGC</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>AGC ROI</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Gain</td>
<td>70</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The parameters that may be set are:

- **Color Palette** - The dropdown allows a choice of stored color tables that define different ways to display the Thermal image. Each camera model may have its own set of color palettes. The user should select the palette most suited to the particular situation.

  Security cameras will most often display scenes using palettes that provide white-on-black or black-on-white images, while for display of industrial images, the color alternatives might be more useful.

  The examples below show how a particular camera (in this case, a PT-334 Thermal Head) display the same Thermal scene using different lookup tables.

![Lookup Table 1](image1) ![Lookup Table 2](image2) ![Lookup Table 3](image3) ![Lookup Table 12](image4)

- **DDE** - (Digital Detail Enhancement) refers to a built-in capability to enhance the thermal images, making it easier to show transitions between different temperature ranges.
  - **Auto** or **Manual** - **Auto setting** allows the settings made in this Tab to be used, while **Manual** allows the settings made through the camera's web page to be retained.

  **DDE Gain** - Slider setting. When DDE is set to Automatic, the user can change the DDE Gain setting here without using the camera's Web Page.

  **AGC** - (Automatic Gain Control): Each camera model may have its own set of AGC settings. The user should select the setting most suited to the particular situation. Typical settings are **Manual, Linear, Plateau, Once Bright, Auto Bright**, etc.
**AGC ROI** - (AGC Region of Interest) - Similar to AGC settings. Each camera model may have its own set of AGC ROI choices. Depending on where the camera is situated, an appropriate ROI should be selected. (For example, where part of the camera's field of view includes the sky, one would normally use a setting that excludes this part of the image).

Typical settings are **Custom** (allowing the user to 'paint' the desired ROI), **Full Screen**, **Horizontal OPT**, **Sky OPT**, **Center 75 Percentage**, **Center 50 Percentage**, etc.  

**Saving your Settings**

Select the required settings, and then click **Apply**.

**Note on use of ioi Analytics with Thermal Cameras:** (See [Analytics Settings](#) for setup of FLIR Thermal Cameras with Analytic Capabilities)

**Setup of ioi Camera Analytics:**

The Analytics capabilities of ioi cameras are integrated into the Horizon system. For these to be activated, Analytics rules must be defined through the ioi cameras' web pages. This refers to ioi cameras with built-in Analytics only. The Latitude capability of binding TRK101-series Analytic encoders with other IP cameras is **not** currently supported for cameras attached to Horizon.

**Arming/Disarming Analytics:**

Camera Analytics are **Armed** and **Disarmed** through the Control Center Context Menu.

---

*Analytics Armed - Disarm using Context Menu*  
*Analytics Disarmed - Arm using Context Menu*
6.4.1.4 PTZ Settings

The PTZ Tab provides control over all the Pan Tilt Zoom functions of applicable cameras.

PTZ Settings
On Discovery, if the camera is recognized by the system as a supported PTZ camera, then the following fields are all set to the Camera's correct default settings.

The following fields are shown:
- PTZ Settings Check-box
- PTZ Protocol
- Serial Port Settings
  - Communication
  - Serial Address
  - Parity
  - Data Bits
  - Stop Bits
  - Bitrate

Caution: The user should only use these fields when the camera's PTZ functions are controlled through a Serial Port interface (as with an analog PTZ interfaced through an encoder).

Drop-downs indicate where other parameters may be selected. Only values that are valid for the selected parameter are shown. Where parameters are disabled (grayed out) this indicates that no other choices are available.
PTZ Control
The PTZ Control panel allows the user to set up the PTZ Camera's orientation and field of view, store different combinations as 'Presets', set up automatic 'Patterns', and run the Auxiliary mode.

PTZ Control buttons
The PTZ Controls allow the following functions, while in PTZ Control Mode (i.e. the 'Menu' button is not pressed.)

Normal Mode
('Menu' not selected)

Field
Iris
+ Opens the Camera Iris
Auto
Activates Camera's Auto Iris
- Closes Camera 's Iris

Direction Arrows
Moves Camera in the indicated direction
+ Zoom in
- Zoom Out

Focus
+ Focus further
Auto
Activates Camera's Auto Focus
- Focus nearer

Lock (toggle)
Locks the camera - other users cannot operate the PTZ functions

Home
Sends the Camera to its Home position

Speed - Sets the speed of movement when the Direction arrows are selected by the mouse

Preset Drop-down - The Camera can be set to defined orientations called Presets. Select a Preset in the drop-down for the following functions:
  Go - Move the camera to the preset orientation
Set - after moving the camera with the direction arrows and zoom controls, clicking on Set will store the current orientation as the current preset value.

Rename - Allows a name to be defined for the current Preset.

Pattern Drop-down - The camera can store a set of movements as a Pattern, which can be invoked when required. Select a Pattern in the drop-down for the following functions:

Run - When a Pattern has been defined, clicking on Run will cause the Pattern to be carried out.

Rec - Clicking on Rec starts the recording of a pattern.
(The Rec button changes to Stop.)
The Preview window indicates how much of the camera's Record buffer is used while the recording is being made.

The speed, arrow and zoom controls can be used to create a Pattern.
Clicking on Stop ends the recording of the pattern.
Rename - allows the pattern to be named.

Auxiliary Drop-down - Allows selection of Auxiliary functions where installed (e.g. Wipers, Heaters)
Start - Start the selected auxiliary
Stop- Stop the selected auxiliary

PTZ Menu Mode
When the Menu button is pressed, the PTZ's internal menu is displayed in the Preview window.

The Controls below are activated for controlling the Menu.
All other buttons and fields in the PTZ Control panel are disabled.

Menu Mode
('Menu' Selected)
Direction Arrows  Up and Down arrows allow navigation through the menu items
Left and Right buttons allow selection of individual values
Select - activates the selected Menu item
Back - Returns to the previous Menu selection
Saving your Settings
Select the required settings, and then click **Apply**.

6.4.1.5  Motion Detection Settings

**Motion Detection Settings**
The Motion Detection Settings area lists any zones that are already defined, and allows the user to set new detection zones and change the detection parameters if necessary. After making any change to the Motion Detection zones or settings, click on **Apply** to make the change, or **Undo** to revert to the previous settings.

**Motion Detection Zones**
By default, Motion Detection Zone 1 defines the full picture area.

**Editing a Motion Detection Zone**
Any Motion Detection Zones that are defined for this camera will be indicated by numbered blocks in the Preview Window.
Click on the zone in the list to select it. The corresponding zone will be highlighted with a red outline in the Preview window.
The sides of the zone can be changed by hovering the mouse over the edge to get the double-arrow symbol, and the edge can then be dragged larger or smaller.
Hovering the mouse inside the zone will give a four-headed arrow, and then whole zone can then be dragged to a different position.

**Adding a Motion Detection Zone**
Clicking on the Add Zone button adds a new entry to the list of Motion Detection Zones, and indicates the area covered with a corresponding number and a shaded block outlined in red showing the extents of the zone.
You can edit the name given to the zone by clicking on the name, typing the new description, and clicking **Apply**.
Deleting a Motion Detection Zone
Click on the zone to be deleted to select it, and then click on the Delete button. You will be asked to confirm that you want to delete the zone.

Note. There must always be at least one Motion Detection zone defined.

Changing Motion Detection Settings
Sensitivity, Threshold - Default settings are assigned by the system when the camera is discovered. These should generally not be altered.

Pre - and Post- Recording (Seconds) - For cameras that are set to record based on Motion Detection, the system records continuously, and when a motion detection event occurs, then a clip is created including pre-event and post-event recording as defined by these parameters.

Create Bookmark upon motion on - Check this box if bookmarks are required for all motion events.

Saving your Settings
Select the required settings, and then click Apply.

6.4.1.6 Analytics Settings
The Analytics Tab allows the user to set up Intrusion Zones, virtual Tripwires and Masking Areas to be monitored by the Analytics capability of the camera.

The following facilities are available:

Analytics Status
The user can set the status of the Analytics in the camera (Just as this can be done from the Control Center using the Context Menu)
Armed/Disarmed
Change the status of the Analytics.

Clear
Clear all Analytics data, events, alarms (not Settings).

Configuration Source
Analytics settings created and stored in the system are accessed when this switch is set to System. When set to System, the parameter fields are enabled, and the user can define or change settings. These settings are saved on the Horizon system.

When set to Web, the screen will show the current settings that were created using the camera's Web interface. These cannot be edited in this page, and are therefore shown as Disabled.

Create Rule
The user can create three types of Analytic Rules
Clicking on an icon allows the user to use the mouse to create an outline of the required type in the viewing window.

Each left click adds a point to the shape. Right-clicking completes the shape. (For Intrusion Areas and Masking Areas, which are closed shapes, this is is done by connecting the last drawn point to the first.)

The completed shape is shown as a shaded area and given the next available name for that type of rule. (The camera supports up to 4 Rules of each type.).

The Masking Area Rules are always shown at the end of the list.

The user selects a rule in the Rules column, and then the characteristics of each individual rule can be set in this Rules Settings column.

A selected rule may be deleted by clicking the trash icon.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Type</th>
<th>Rule Description/Rule Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Intrusion Area" /></td>
<td>Intrusion Area</td>
<td>The boundary of the Intrusion area reacts to anything crossing it in either direction. The rule may be given one or more 'classified types' (Human, Vehicle, Object) to use as a filter. The camera will attempt react only to the selected classified types, based on size.</td>
</tr>
<tr>
<td><img src="image" alt="Tripwire" /></td>
<td>Tripwire</td>
<td>In addition to the criteria above, the user can select a 'direction' to monitor.</td>
</tr>
<tr>
<td><img src="image" alt="Masking Area" /></td>
<td>Masking Area</td>
<td>Masking areas are used to define areas that should be excluded from the analytics.</td>
</tr>
</tbody>
</table>

Depth Calibration Tab
- **Automatic** The Cameras determines the depth of the scene
- **Relearn** - Clicking the relearn button clears the previous Depth Calibration
- **Manua** Allows the user to create a calibration plane using the mouse and runs it again (Can take several minutes)
- **Disabl** No Depth Calibration is used

**General Settings Tab**
This tab allows the user to set how the Analytics will be displayed when the camera is viewed.

**Show Object Detection**
* No boxes: doesn't show a bounding box around moving targets, even if they trigger an event
* Classified boxes: shows a black bounding box around targets that have been classified, for example Human. When it triggers an event it will change to white
* All boxes: shows a black bounding box around all moving targets, it changes to white when it triggers an event

**Show Lines:**
When selected it will show tracking lines, when not selected it does not.

**Show regions:**
When selected, draws regions in black (when a region or tripwire is active it changes to white)
When not selected, shows no regions

As a general recommendation, we suggest enabling drawing Regions and Classified Boxes.

**Saving your Settings**
Select the required settings, and then click **Apply**.
7 Users Screens

Users are managed using the following screens

**Users** - this screen lists all the Users who are registered in the system and allows users to be edited. New Users are added using the Add Users screen.

**User Groups** - this screen shows the 3 default User group definitions, and any groups others added, using the Add User Group screen.

7.1 Rules and Alarms Screens

Alarms are definitions of how the system should respond to Events. Alarms can trigger live video and/or recording displays on Control Center consoles, and Alert messages to be sent to associated individual users and/or user groups. These messages must be responded to and 'cleared' by the recipients.

Rules are definitions of what Events can be recognized by the system, and how the system must respond - by raising Alarms, changing the state of switches, sending messages, etc.

Alarms define what video information must be brought to a user's attention. The Alarms screen lists all the defined alarms, and additional alarms are defined using the Add Alarm screen.
7.1.1  Rules

Rules are definitions of what Events can be recognized by the system, and how the system must respond - by raising Alarms, changing the state of switches, sending messages, etc.

The Rule screen lists all Rules that are defined in the system. Select a Rule by clicking it with the mouse, and a summary of that rule is shown in the bottom of the screen.

For more information: Add a Rule  Schedule a Rule
Add a Rule

   ![Add Rule Window](image)

   - Rule Name
   - Event
     - Select the event that will trigger the action
     - Select Alarm
   - Action
     - Select the action
     - Output pin

   *All fields are mandatory

2. Add the Rule information. The fields structure and contents varies depending on the Event Type and Action required. (See Events Types, below).
   Note: Take care to complete all fields.
3. Click Save to return to the Rules screen.
Schedule a Rule
1. Once a Rule is defined, click on the Rules Scheduling button to open the Rules Scheduling screen.
   By default, the schedule will be set to Always.

   ![Schedule Screen]

2. In the Selection Mode panel, select Continuous or None, and use the mouse to click-and-drag that selection for the required hours/days.
3. When complete, click Save to return to the Rules screen.

Delete a Rule
From the Rules screen, select a rule and click the Delete button. You will be asked to confirm that you want to delete the Rule.

Events that are Triggered by Camera Analytics

The Analytics capabilities of ioi cameras are integrated into the Horizon system. For these to be activated, Analytics rules must be defined through the ioi cameras' web pages, and the camera/s must be set to Armed (using the Control Center Context Menu).
7.1.2 Alarms

Alarms define what video information must be brought to a user's attention. The Alarms screen lists all the defined alarms. Additional alarms are defined using the Add Alarm screen.
To add a new Alarm
1. Click Add Alarm to add a new alarm to the system.
   The Add Alarm dialog is presented.

2. Fill in the required fields.

   **General Settings**
   Provide a Name to the alarm and set its priority (Critical, High, Medium, Low or Very Low).

   Select whether the alarm should be automatically cleared or not.
   If Yes, also set the time for the system to wait before automatically clearing the alarm (Hrs, Mins, Secs, range 1 sec - 24Hrs.)

   Selecting 'Record cameras associated with this alarm' will create a recorded clip for all
   the cameras which are associated with this alarm.
   The clip duration will be for the selected number of seconds before and after the trigger
   event.

   **Cameras - Table showing all 'Attached' Cameras, and which are
   'Associated' with this Alarm**
   Select camera/s that will be associated with the alarm by clicking on them in 'Available'
   column, and clicking the arrow to move them to the 'Associated' column.
   (Deselect cameras by clicking them in the 'Associated' column and clicking the reverse
   arrow)
For the selected cameras, you can choose whether live video will be displayed ('View Live', selected by default) and/or playback ('View Playback') will be displayed. For playbacks, the time range should be specified (Pre- and Post-alarm).

**Recipients**
Select users and/or user groups who will receive the alarm when it is triggered.  
**Note:** User groups (icon) are displayed in bold type  
Users (icon) are displayed in regular type

When all required fields have been entered, click **Save**. The system will return to the 'Alarm' screen, and the new/changed Alarms will appear in the list of Alarms.

**To Edit an Alarm**
From the Alarms screen, select an alarm and click **Edit**, or double-click on the alarm. The **Edit Alarm** dialog box will open showing the information for the selected alarm. Make the required changes and click **Save**.

**To Delete an Alarm**
From the Alarms screen, select an alarm and click **Delete**. You will be asked to confirm that you want to remove the alarm.
7.2 Users

This screen lists all the Users who are registered in the system, allows users to be edited, or added using the Add Users screen.

Edit a User

1. Select a User by clicking an entry in the User screen.
2. Click on the Edit button 📊. The Edit User screen opens, with the selected User displayed.
3. Edit the information as required.
4. Click Save to return to the User screen.

**Add User**
1. Click Add User in the User screen. The Add User window opens.
2. Add the User information.
   - **Note:** Take care to complete all mandatory fields as indicated (*).
3. Click Save to return to the User screen.

**Delete a User**
1. Select a User by clicking an entry in the User screen.
2. Click on the Delete button. You will be asked to confirm that you want to delete the user.

**7.3 User Groups**
This screen shows the 3 default User group definitions, and allows more User Groups to be defined using the Add User Group screen.
Edit User Group
1. Click on the User Group to be edited in the User Group screen.

Note: The settings for the default User Groups can be displayed using the Edit button, but they are fixed - they can not be edited. (Administrators, Supervisors, Operators)

2. Edit the required information.
3. Click the Save button to Save and return to the User Groups screen.

Add User Group
2. Add the User Group information.
   **Note:** Take care to complete all mandatory fields as indicated (*).

3. Click Save to return to the User Group screen.

**Delete User Group**
1. Select a User Group by clicking an entry in the User Group screen.
2. Click on the Delete button. You will be asked to confirm that you want to delete the user.

**Note:** You cannot delete a User Group if it still has members. Before trying to delete a User Group, make sure you have transferred all Users in that group to alternative User Groups.
8 About this File

Welcome to the United VMS 8.0 Horizon Admin Center Help File.
Note: Changes to this file were last introduced after Application Build No: 5000
